

## **Project : I'm Playing And Learning**

The future method of learning quickly is "Mind or Intelligence games". Brain Games; It is a training method that opens the mind, works the mind, facilitates learning, and provides quick learning. This method was taught at all levels in schools as a teaching method in advanced world countries many years ago. Brain Games; It is a general name given to questions that do not require information and can be solved by using skills such as reasoning, quick thinking, creativity, and the ability to benefit from clues. "Brain Games", which open the mind, train the mind, facilitate learning and provide quick learning, are the education method of the future. Intelligence games based on the principle of "learning while having fun" contribute to children's intelligence development, creativity and academic success as they open the mind and facilitate learning. Children learn while having fun and their intelligence develops. In our project, we will integrate mind and intelligence games into the lessons. They will both have fun and learn while playing.
